
MIT-Stanford, 135 cells (115 train / 20 test), N=23 clients — thin lines are individual seeds, thick line is their mean
H1: FedAvg / IID vs C0 centralized
FedAvg / IID, 10 local epochs (n=32, mean)
FedAvg / IID, 3 local epochs (budget-matched) (n=48, mean)
C0 centralized, 300 epochs (n=8)
H2: FedAvg under label skew (sohrank) / quantity skew (Dirichlet)
FedAvg / IID (skew 17.3%) (n=32, mean)
FedAvg / Dirichlet α=0.5 (skew 12.2%) (n=8, mean)
FedAvg / SOH-ranked shards (skew 47.1%) (n=32, mean)
C0 centralized, 300 epochs (n=8)
H3: FedProx at μ=0.01 / 0.1 vs FedAvg, same partition
FedAvg / Dirichlet α=0.5 (n=8, mean)
FedProx μ=0.01 / Dirichlet α=0.5 (n=8, mean)
FedProx μ=0.1 / Dirichlet α=0.5 (n=8, mean)
C0 centralized, 300 epochs (n=8)
test MAE (log scale)
federated round
